DSE 1271 Data Visualization [1032]

SALES AND STRATEGY OPTIMIZATION

Insights from Hypermart Data Analysis

Submitted by:

Meenakshi Sangeeth

240905630

1. Objective of the Analysis

In today's competitive retail landscape, data-driven decision-making is crucial for sustaining growth and improving customer satisfaction. This analysis focuses on **Hypermart**, a large-scale retail business, with the aim of uncovering valuable insights from transactional and customer data. The key objectives of this analysis are as follows:

- *Data Distribution and Trends*: Understanding the overall flow of data helps in identifying what drives performance and where inefficiencies may lie
- *Customer Segmentation & Regional Insights*: A deeper dive into customer demographics and regional sales patterns reveals who the best customers are and where they are located
- *Growth Opportunities & Market Expansion*: Identifying untapped potential is key to strategic planning and business growth

By combining exploratory data analysis with visualization techniques, this project aims to present clear, actionable recommendations that can drive smarter operations and improved profitability for Hypermart

2. Data Exploration

Understanding the structure and quality of the dataset is a crucial first step in any analysis. The initial Hypermart dataset contains 9,994 records and initially features 21 attributes, covering a range of attributes across different categories:

- *Transactional Data*: Order ID, Order Date, Ship Date, Sales, Quantity, Discount, Profit
- *Customer Information*: Customer ID, Customer Name, Segment
- *Product Details*: Product ID, Product Name, Category, Sub-Category

- *Logistics*: Ship Mode, City, State, Region, Country
- *System-Generated Fields*: Row ID, Postal Code

This data exploration stage aims to assess the distribution of numerical values and detect any issues such as outliers, missing data, or irrelevant attributes. A preliminary statistical summary was performed on key numerical features to assess their central tendencies, dispersion, and the presence of extreme values.

	Row ID	Postal Code	Sales	Quantity	Discount	Profit
count	9994.000000	9994.000000	9994.000000	9994.000000	9994.000000	9994.000000
mean	4997.500000	55190.379428	229.858001	3.789574	0.156203	28.656896
std	2885.163629	32063.693350	623.245101	2.225110	0.206452	234.260108
min	1.000000	1040.000000	0.444000	1.000000	0.000000	-6599.978000
25%	2499.250000	23223.000000	17.280000	2.000000	0.000000	1.728750
50%	4997.500000	56430.500000	54.490000	3.000000	0.200000	8.666500
75%	7495.750000	90008.000000	209.940000	5.000000	0.200000	29.364000
max	9994.000000	99301.000000	22638.480000	14.000000	0.800000	8399.976000

Observations:

- Sales and Profit have extremely high maximum values compared to their means and medians, indicating heavy right-skew.
- The standard deviation of Profit (234.26) is almost 8x the mean (28.66), pointing to the presence of large outliers.
- Discount is often 0 or 0.2, reflecting predefined discount strategies (likely promotional thresholds).
- Quantity has a more reasonable spread, though there are still some larger orders (up to 14 units)
- The attributes Row ID and Postal Code don't provide meaningful insights for analysis

3. Data Cleaning

To make the dataset reliable for analysis, several cleaning steps were applied:

3.1 Dropping Unnecessary Columns and Duplicates

- Row ID and Postal Code were dropped as they don't provide analytical value
- Duplicate records were removed to prevent data bias

3.2 Missing Values and Categorical Checks

- The dataset was checked for missing values, and no missing data was found across all attributes.
- Categorical variables such as Region, Segment, Category, and Ship Mode were reviewed for consistency. All categories were clean and logically labelled, with no anomalies or spelling issues.

3.3 Outlier Removal

To reduce the influence of extreme values and create a more representative dataset, outliers in the numerical columns were removed using the Interquartile Range (IQR) method. This was applied to Sales, Profit, Discount, and Quantity

	Sales	Quantity	Discount	Profit
count	6705.000000	6705.000000	6705.000000	6705.000000
mean	66.759993	3.367934	0.096944	11.239461
std	84.432109	1.864171	0.105461	13.010715
min	0.990000	1.000000	0.000000	-27.715800
25%	14.850000	2.000000	0.000000	3.210000
50%	34.384000	3.000000	0.000000	7.783200
75%	82.260000	4.000000	0.200000	17.182800
max	496.860000	9.000000	0.500000	50.584800

After outlier removal, the dataset became more statistically balanced, particularly:

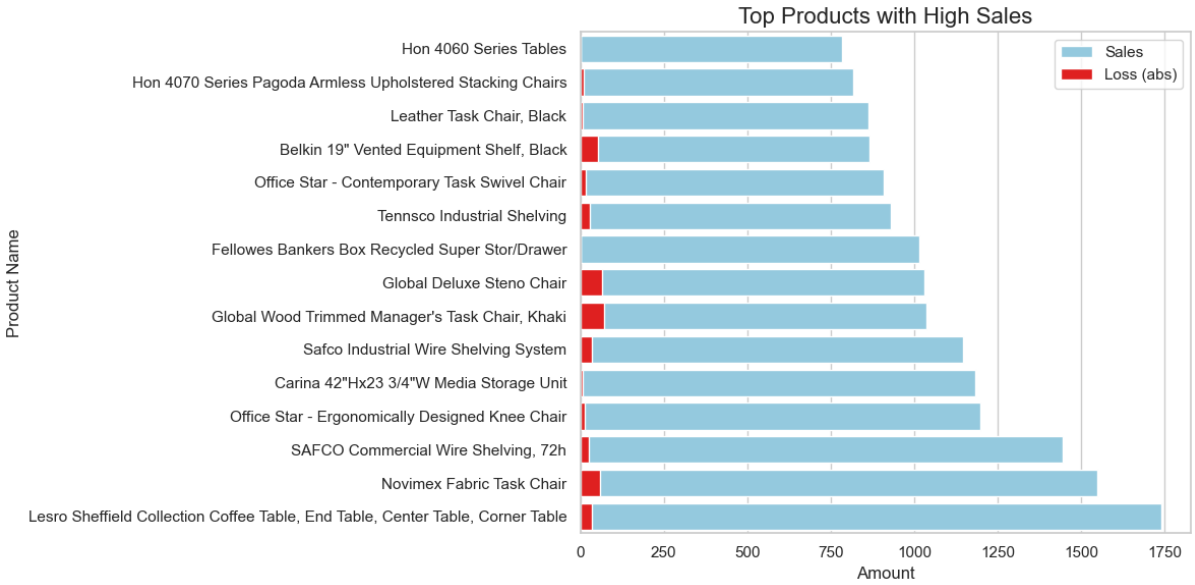
- The mean Sales dropped significantly from ~229 to ~67, reducing the influence of large enterprise transactions.
- Profit is now less volatile, with a much lower standard deviation and tighter range.
- Discounts are now mostly concentrated at 0 and 0.2, showing more common discount practices.
- Quantity distribution also became more realistic, focusing on smaller order sizes.

After completing the data cleaning steps, the dataset is now complete and well-organized. All missing values have been handled, and outliers in key numerical columns have been removed. This ensures that the analysis and visualizations that follow are based on accurate and consistent data, which improves the quality and reliability of the insights we can draw.

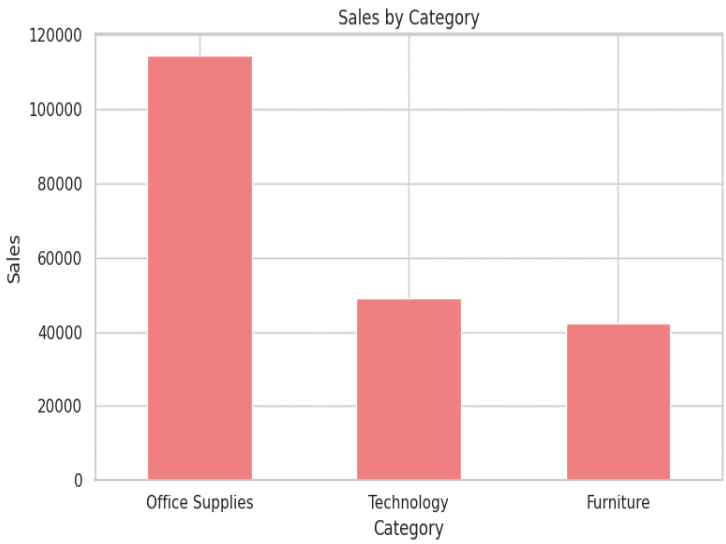
4. Analysis and Insights

Understanding business performance goes beyond reviewing numbers — it's about uncovering the patterns that drive growth. Through careful examination of sales trends, customer segments, and regional dynamics, we aim to identify what works well and where improvements can be made. By analysing the distribution of key variables, comparing segment performance, and spotting areas with hidden potential, we can turn data into actionable insights.

4.1 Data distribution and Trends

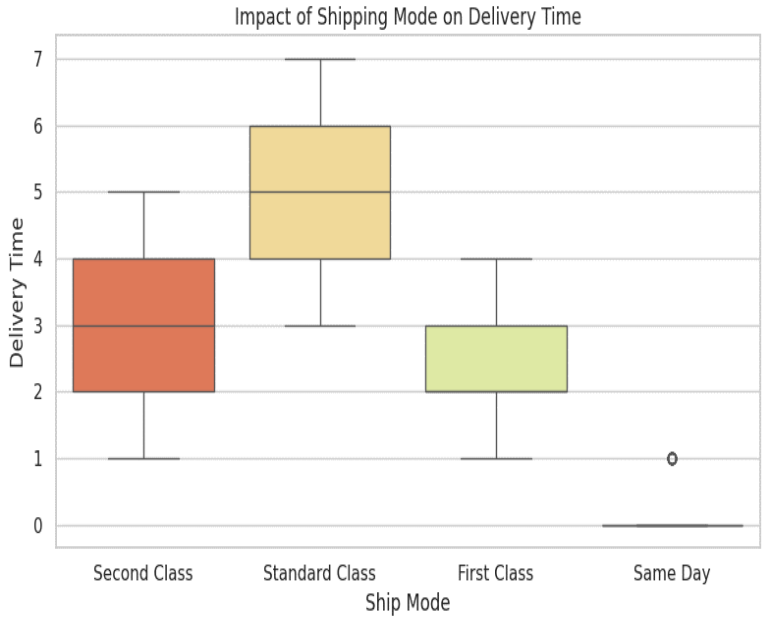


While certain products achieve impressive sales figures, some tech-related products and storage items incur noticeable losses potentially due to discounts, high return rates, or low margins. Businesses should carefully evaluate pricing, cost structures, and promotional strategies for these high-revenue but low-margin products to avoid long-term financial inefficiencies

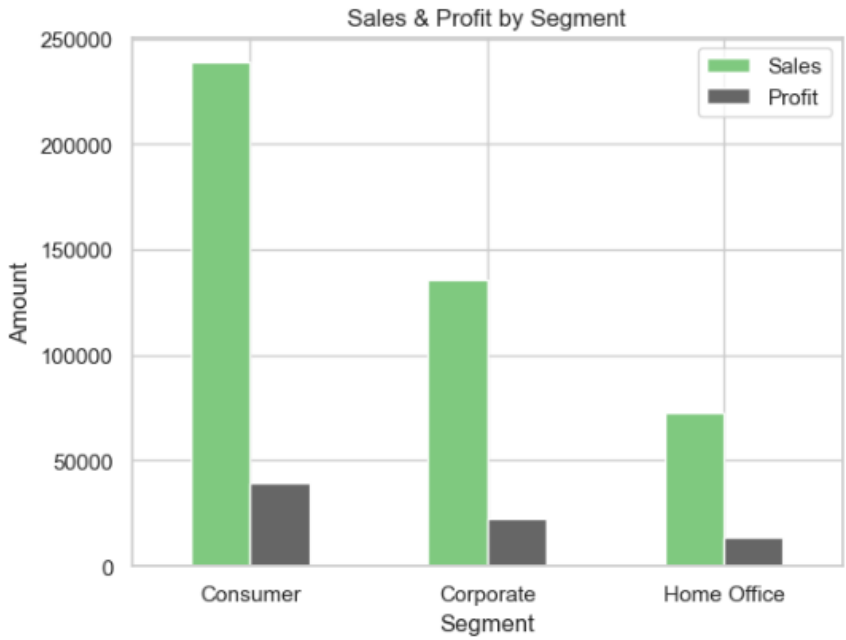


Office Supplies is the most in-demand category, likely due to its broad utility and frequency of purchase. This suggests a stable revenue stream. However, Technology, despite lower total sales, may offer higher-margin opportunities depending on the product

Shipping mode significantly influences delivery performance. Customers opting for faster delivery (e.g., Same Day) experience more consistent and rapid service, which could boost customer satisfaction. Businesses might consider promoting premium shipping for urgent orders or adjusting expectations based on mode selection.



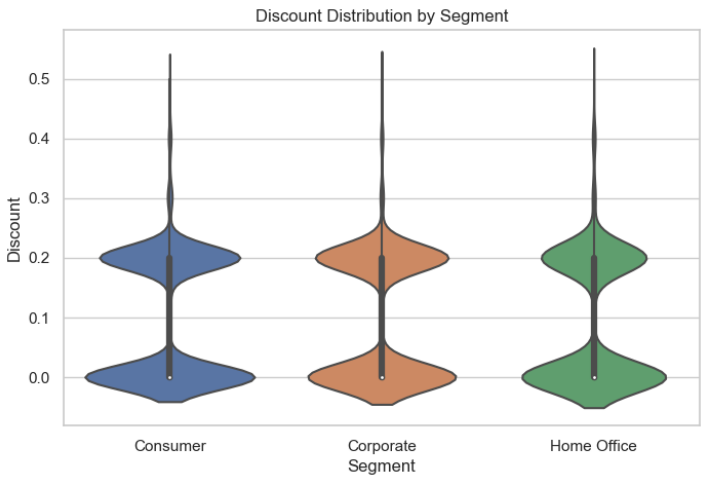
4.2 Data distribution and Trends



Consumer customers are the most valuable in terms of both revenue and profit. Corporate clients generate substantial sales but may require better cost management or pricing strategies to enhance profitability. Targeted approaches to

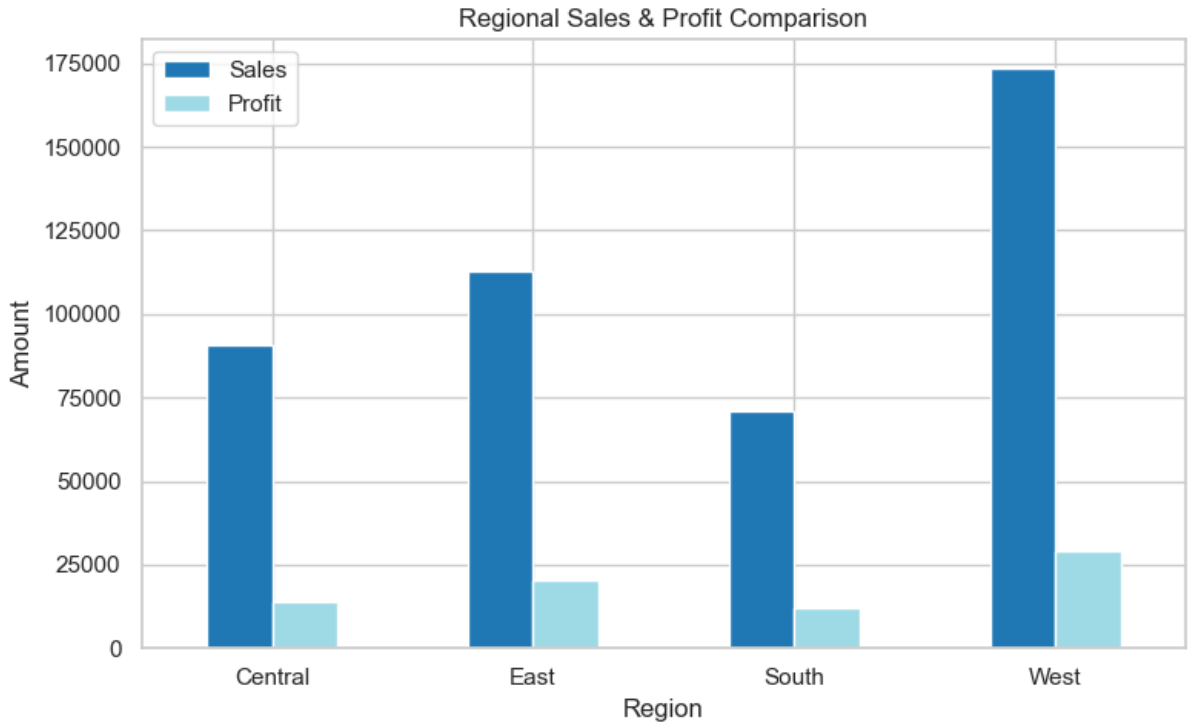
optimize returns from Corporate and Home Office segments could lead to improved overall performance

Customer loyalty is evident in the mid-range, suggesting a stable customer base. However, there's potential to convert moderate repeat customers into high-value ones through loyalty incentives, tailored communication, and improved post-purchase experiences

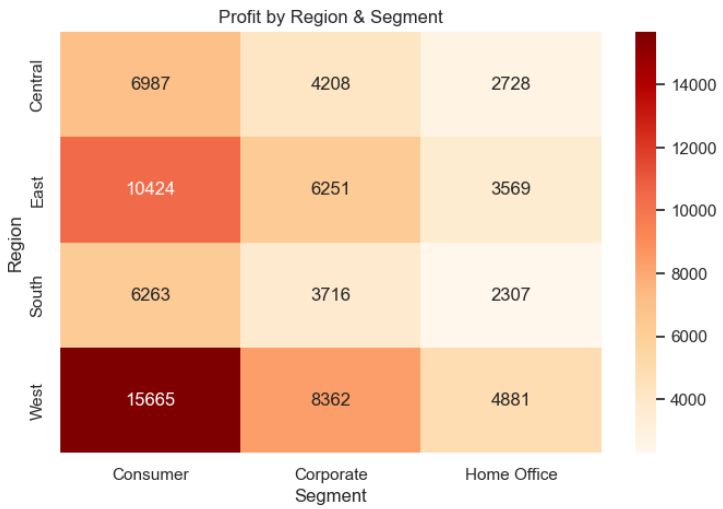


Discount strategies appear fairly consistent across segments, but the slight variance suggests Home Office may be more price-sensitive. Businesses can test personalized discount models for different segments to improve conversion without eroding margins

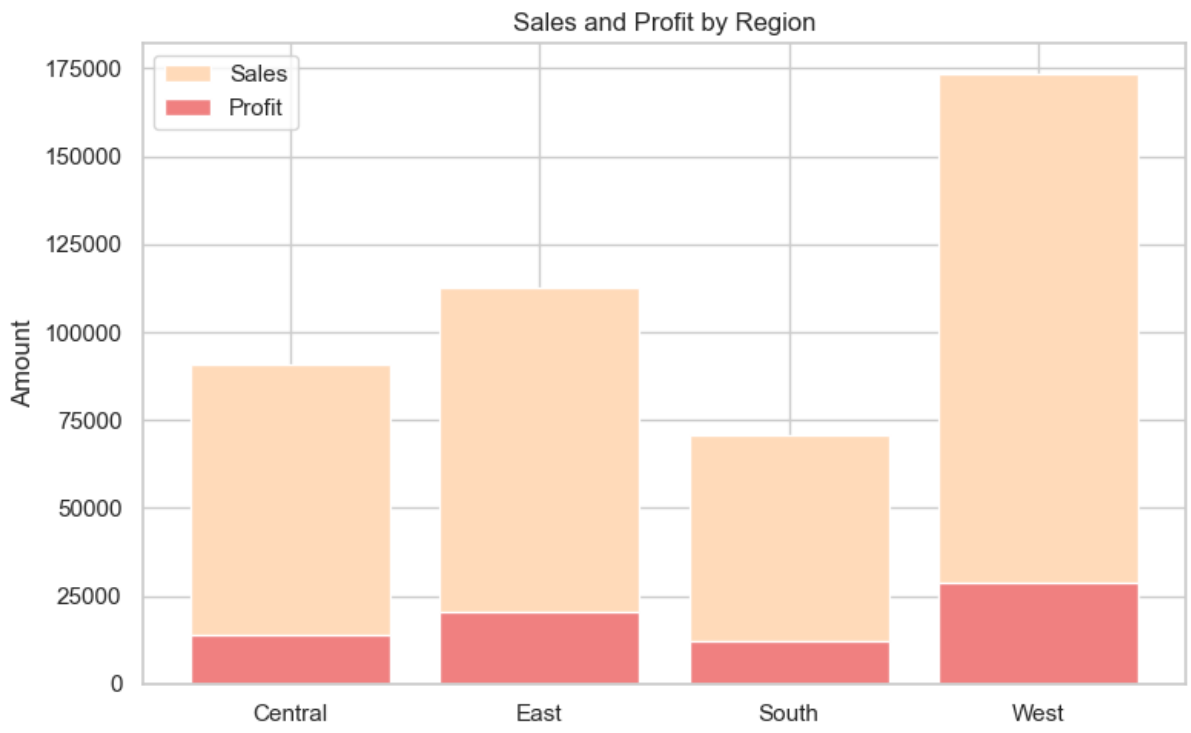
4.3 Growth Opportunities & Market Expansion



The West is a strong performer and could serve as a benchmark for other regions. The South, on the other hand, shows signs of stagnation and may require strategic interventions—like improved promotions, optimized pricing, or localized campaigns—to boost its contribution



There is room to grow underrepresented segments in weaker regions. For instance, Corporate customers in the South could be re-engaged through B2B offers or relationship-based sales. Home Office segments in all regions, especially South and East, are prime candidates for targeted promotions or bundled product offerings



The West and East regions are already well-developed markets. Strategic pricing or cross-sell opportunities could help extract more value. The South represents an untapped market—a focus on improving profit margins and increasing customer base here could unlock new growth potential

5. Conclusion

This analytical exploration into Hypermart's sales and customer data reveals a story not just of numbers, but of strategic direction and opportunity. The patterns hidden within the data shed light on how customers engage, where the business thrives, and where untapped growth potential lies waiting to be explored.

The Consumer segment emerges as the most consistent and profitable engine of revenue. Its broad base and strong performance signal a segment that responds well to current strategies—offering a model for engagement. In contrast, the Corporate segment, while generating significant sales, contributes relatively less to profit, suggesting the need for a more margin-focused approach. The Home

Office segment, quieter in volume and value, represents a space with room for innovation—where tailored offers and refined messaging could create new value.

Regionally, the West stands out as a flagship, delivering impressive sales and profitability. Its success suggests a mature market, one that can be further optimized through refined segmentation and value-add strategies. The East follows closely, offering stable returns with potential for elevation. Meanwhile, the South, though modest in current performance, may hold the greatest opportunity—underdeveloped yet full of promise for targeted expansion, particularly through focused attention on overlooked customer segments.

Across all segments and regions, repeat purchase behavior highlights a stable but under-leveraged customer base. Most customers place 3–6 orders, but few progress beyond that. Encouraging deeper engagement through loyalty programs, bundled offers, or personalized experiences may unlock lifetime value that remains dormant.

Furthermore, discount patterns suggest consistency, but also hint at the potential for smarter, segment-specific pricing. Especially in price-sensitive groups like Home Office, a re-examination of discount structures may strike a better balance between conversion and margin.

Taken together, these insights form a blueprint for growth. By nurturing high-performing segments, re-engaging underutilized ones, and directing attention to underperforming regions, Hypermart is well-positioned to not only sustain but scale its success.

This analysis reaffirms that data, when properly harnessed, is not just descriptive—it is directive. It offers clarity in complexity, and most importantly, guides strategy with purpose
